# bRing

Safely bringing joy into your home\*

Team Members: Emily Shao, Joshua Chen, Bryant Chung

## The Problem (Key Motivation)

### The Problem (Costs & Materials)

- Lost cost
- Connects to wift
- Captures image + stores data
  - Before sending it over

### System Design

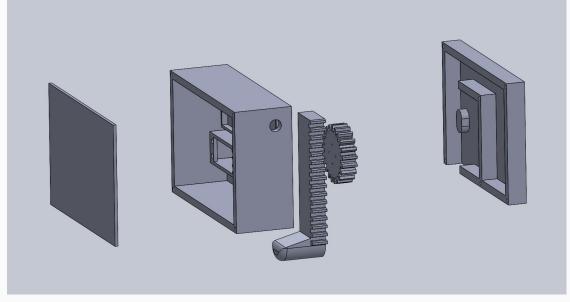

### **End-to-end Workflow**

## Applied Techniques / Methods: Hardware

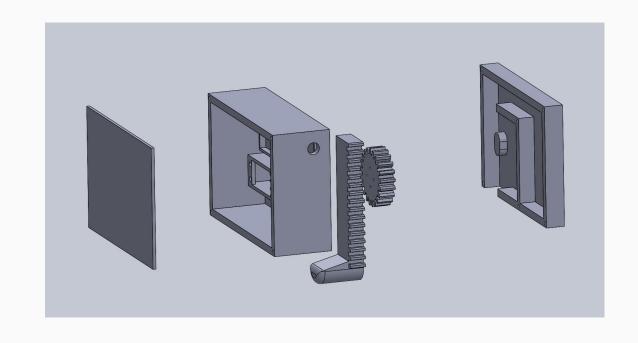

### Applied Techniques / Methods: Hardware

- Rack & Pinion
- Component storage

- 3D printed design
- 15kg Servo Motor

### Applied Techniques / Methods: Firmware

#### Lab 1: GPIO, timer, interrupt

- ISR handler for button
- GPIO pins for pin mappings

#### Lab 2: PWM, OLED, ADC

PWM to control the motor

#### Lab 4: WiFi & HTTP API

- Connecting to WiFi
- Sending and receiving HTTP GET and POST requests

#### Extra:

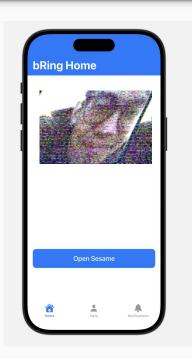

Controlling 07670 camera

### Applied Techniques / Methods: Software

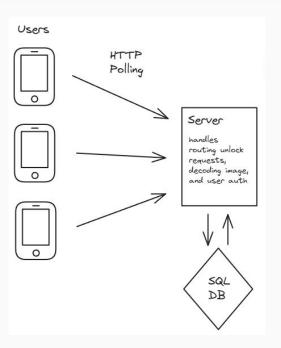

- REST API Server coordinates door unlocking workflow
- Locking and Concurrent API handling
- Image Conversion: RGB565 -> PNG
- Responsive mobile app built with Swift
- Polling and HTTP requests

### Interfaces: "Receiving request"

- Original: Apple Push Notifications (APN) service
  - Multiple users
  - Distinguish by users

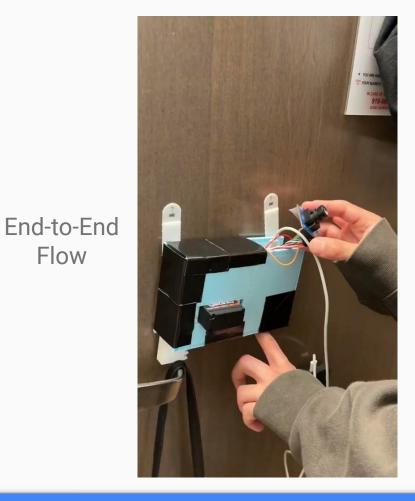

- Alternative: polling
  - one way communication

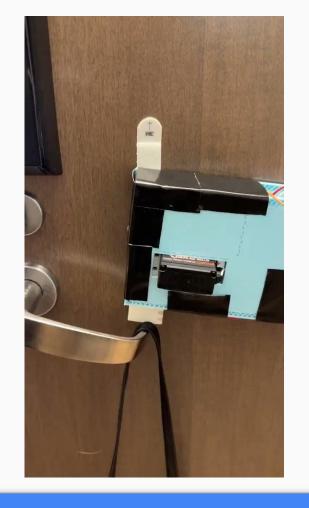

### Interfaces: Software / Backend

```

Open Sesame!

Flow

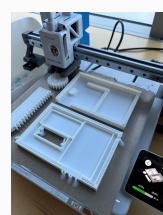

- Working with ESP32 camera
  - Issues with camera setup -> limited on-board memory, couldn't process higher res images
  - Image conversion camera recorded in RGB565 with loss of pixels
- iOS mobile app development many features of iOS gated behind Apple
  - Developer account (\$99/year) and had to find workarounds
    - Infrequent polling
    - Local notifications (instead of push)
- Mechanical design of door opener
  - 3D Prints kept failing
  - Weak motor, gear slipping

### Possible Next Steps

- Refine definition camera
  - External PSRAM storage
- Implement ML model for facial recognition
- Publish to App Store
- Stronger motor
